How it works

Put simply, the solar panel
charges a 12V battery*
during the day, which then
powers the light at night. Bright
sunlight is not necessary for
charging to occur - the system
will work even with overcast
daytime conditions, both in
summer and winter.

* Battery not supplied - use any car
or caravan battery

Benefits of

- Using patented 3rd Generation solar cells, exclusively supplied to Solaris, provides greater power in cloudy conditions. The crystalline or amorphous cells used in 2005 provide up to three and a half times the power of standard solar cells. It's a simple equation: more power + a larger solar cell surface = longer lasting light.
- The bulb used in 2005 is now obsolete, providing a significant increase in power while retaining its 100,000 hours warranty guarantee.
- All the internal circuits and components are fully protected against the elements. STI lights can be left out all year long, free of possibilities of deterioration.
- Only the finest no-rust grade stainless steel is used in modern lights and heavy duty
